

THE MOLE: 6.022×10^{23}

WHAT IS A MOLE?

One mole is the amount of a substance that contains exactly $6.02214076 \times 10^{23}$ atoms, molecules or ions. This number is also known as 'Avogadro's Number' (N_A). It is named after the Italian scientist Amedeo Avogadro (left), which was a suggestion put forward by French scientist Jean Perrin to recognise Avogadro's work.

One mole is essentially _____

602,214,076,000,000,000,000,000,000

_____ of something - in chemistry, atoms or molecules

Water

Iron

Oxygen

Table Salt

Gold

Helium

ONE MOLE IS A DIFFERENT MASS FOR DIFFERENT ELEMENTS & COMPOUNDS

This may seem confusing; however, it's similar to comparing a dozen elephants to a dozen mice. Although their masses may be very different, you still have a dozen of each!

A mole is often referred to as 'a chemist's dozen'

IT'S JUST AN EASIER WAY TO COUNT LARGE NUMBERS OF ATOMS & MOLECULES

$$\text{NO. OF MOLES} = \text{MASS (g)} \div \text{MASS OF 1 MOLE (g)}$$
